Brainstorming & Idea Prioritization

Project: Implement Client Script & UI Policy (Incident)

Date: 03 October 2026

Team ID: SWTID-2026-5957

Maximum Marks: 3 Marks

Team Name: Incident Client Script & UI Policy Team

Team Leader: RIFANA FIRDOUS J

Project Name: Implement Client Script & UI Policy (Incident)

Team Members

S.No	Team Member
1	**RIFANA FIRDOUS J** (Team Leader)
2	SIVARANJANI S
3	SIVA SHREE S

Step 1: Brainstorm and Idea Listing

Each team member lists possible ideas for implementing Client Scripts and UI Policies on the ServiceNow Incident form. Ideas focus on form behavior, validation, visibility, mandatory fields, read-only controls, and a smoother incident-entry experience.

S.No	Team Member	Idea / Suggestion	Category	Group
1	RIFANA FIRDOUS J	Use an onChange Client Script to respond to Incident State changes and guide users during resolution.	Client Script	1
2	SIVARANJANI S	Use a UI Policy to make Resolution Notes mandatory when the Incident State becomes Resolved.	UI Policy	2
3	SIVA SHREE S	Use UI Policy actions to make selected fields read-only or hidden when the incident reaches a controlled state.	UI Policy	3
4	SIVARANJANI S	Use an onLoad Client Script to set or validate initial form behavior and improve the Incident form experience.	Client Script	4
5	SIVA SHREE S	Use an onSubmit Client Script for client-side validation before an Incident is submitted or updated.	Client Script	5
6	RIFANA FIRDOUS J	Test Client Scripts and UI Policies across relevant form states and views, including reverse conditions where needed.	Testing	6

Step 2: Idea Prioritization

Rate each grouped idea on feasibility and importance, then select the final ideas to move forward with. The prioritization below is aligned to the project scope of implementing Incident Client Scripts and UI Policies.

Group No.	Grouped Idea	Feasibility	Importance	Priority Selected
1	OnChange Client Script for Incident State guidance	High	High	Yes
2	UI Policy to make Resolution Notes mandatory on Resolved state	High	High	Yes
3	UI Policy actions for field visibility/read-only behavior	High	High	Yes
4	onLoad Client Script for initial form behavior	Medium	Medium	No
5	onSubmit Client Script for client-side validation	High	High	Yes
6	Functional testing of scripts, policies and reverse conditions	High	High	Yes

Final Selected Ideas

1. Implement an onChange Client Script to provide appropriate behavior when the Incident State changes.
2. Implement a UI Policy that makes Resolution Notes mandatory when an Incident is moved to Resolved.
3. Configure UI Policy actions for field visibility and read-only behavior based on Incident conditions.
4. Add onSubmit client-side validation where appropriate before the Incident form is submitted.
5. Perform functional testing for conditions, reverse conditions, form behavior, and expected field states.

Technical Note: ServiceNow documentation describes Client Scripts as client-side form behavior tools for events such as onLoad, onChange and onSubmit, while UI Policies can control field mandatory, visibility and read-only behavior. ServiceNow recommends using UI Policies where they can achieve the required behavior without scripting.
